

Secure your Device & Wi-fi Safety Guide

Your devices hold your photos, messages, passwords, and probably your whole life. Let's keep them safe — and make hackers work a little harder.

Keep It Updated

Those software updates aren't just annoying pop-ups — they fix holes hackers love. Turn on **automatic updates** so you don't have to remember.

Lock It Up

Use a **PIN, password, fingerprint, or Face ID.**

A locked screen keeps wandering eyes and sticky fingers out.

Find My Device = Your Backup Plan

Turn on **Find My Device** (Apple / Android) so you can locate, lock, or erase it if it disappears.

Be Smart with Wi-Fi

- **Avoid public Wi-Fi** for anything involving money, passwords, or sensitive info.
- If you must connect, use a **VPN (Virtual Private Network)** it hides your data like an invisibility cloak.
- **Cellular data** is safer than that free café connection.

Stick to Trusted Apps

Only download from official app stores.

Sketchy apps = sketchy results (and sometimes malware).

Back It Up

Use cloud backup or an external drive.

If your device crashes, your memories and files won't go down with it.
